

Venoplant®

cream gel

VENOPLANT Cream Gel is a formulation containing active ingredients with recognized vasoprotective action, effective in fostering a physiological improvement of the microcirculation tropism and of the capillary tone in case of swelling, heaviness, night restlessness in the legs, swelling of orthopedic and trauma origin.

VENOPLANT Cream Gel contains as emulsifier a patented lipoprotein plant compound: OLIVOIL GLUTINATE.

This substance, derived from olive oil and proteins of wheat, gives the cream gel an excellent skin tolerance and efficient absorption of the functional ingredients.

Active ingredients of **Venoplant Cream Gel**:

- **ESCIN**

It is the main component of Horse chestnut seed that has been shown, in many experimental models, to own anti-inflammatory and antiexudative activities and the ability to reduce the capillary permeability. The decrease of vascular permeability prevents the leakage of proteic molecules, electrolytes and water into the surrounding tissues, thus reducing the symptoms of venous disorders such as swollen legs, heaviness, pain and itching.

- **TRITERPENIC FRACTION OF CENTELLA EXTRACT**

Asiatic Centella is a plant for long time known and used for therapeutic purposes. It is rich in triterpenoid substances that have therapeutic activity on skin tissue and venous circulation.

The triterpenoid fraction consists of: Asiatic Acid (30%), Madecassic Acid (30%) and Asiaticoside (40%), substances that stimulate the connective tissue tropism and control the permeability of microcirculation.

Therefore they possess the property to simulate the integrity of the connective tissue improving the elasticity of the subcutaneous tissue and venous vessel and they have the ability to help the physiological function of drainage of tissue fluids whose stagnation causes cellulite, swelling and heaviness in lower limbs.

- **MELILOT**

The leaves of this plant are used.

They contains the active ingredient used in medicine: COUMARIN that thanks to its high lipophilicity, it is totally absorbed at skin level. Coumarin stimulates the action of proteolytic enzymes in macrophages eliminating the main cause of edema caused by venous insufficiency. The anti-edema action of the substance reduces the formation of edema from venous and lymphatic stasis of any origin, also in traumatology and orthopedics purposes.

- **HEPARIN**

It is a mucopolysaccharide able to act on the emo-coagulative cascade and it is used for its anticoagulant action. Therefore the dermal use can reduce formation of hematomas and exudates due to trauma, bruises or venous circulatory disorders.

Packaging

VENOPLANT Cream Gel is provided in 100 ml tube.

How to use

Apply on the affected area a thin layer of cream gel one or more times during the day. Massage very gently the area until the cream gel has been completely absorbed.

Venoplant® line

www.venoplant.it

Venoplant Enterosoma-I® Gastro-protected tablets

A nutritional supplement containing micronised Diosmin and titrated dry extracts of Melilotus, which aid vein circulation and rectal venous plexus function, and titrated dry extract of Centella Asiatica, which favours the normal functioning of the microcirculation and fights cellulite skin beauty problems.
